

**I've always loved computer vision counters —
but endless code made them hard to use.
I needed a better way.**

That is why I created an app everyone can use!

ComputerVision Counter —
Count anything without coding
(for images)

A STEP forward in computer vision

Using it in your workflow is a great STEP forward, because it's...

S - safe – keep data offline, under your control

T - time saving – let the computer do the counting

E - easy – no coding, just a simple UI

P - portable – everything in one folder

How it works ?

- Add images
- Select model & choose classes
- Start

*Your data + your model = fast detection,
reliable object counts, zero programming.*

The screenshot shows the 'ComputerVision Counter' application window. The title bar reads 'ComputerVision Counter — Count anything without coding'. The interface is organized into several sections:
1. **Paths**: Includes fields for 'Input folder (images):', 'Output folder (optional):', and 'Weights (.pt):', each with a 'Browse...' button. A 'Pick images...' button and a 'Clear' button are also present.
2. **Quality presets**: A slider is set to '3' (Ultra). The text 'Ultra • tile=2560 overlap=0.6 conf=0.75 nms=0.4 WBF=True' is displayed, along with an 'Advanced...' button.
3. **Areas of Interest (AOI)**: Contains checkboxes for 'Require AOI for every image' and 'Use AOI (draw polygons — finish with Ctrl+Enter, undo vertex: Ctrl+Backspace)'. Below these are radio buttons for 'Centroid inside polygon' (selected) and 'Box-area fraction', and a text field for 'min box fraction inside AOI' set to '0.20'. An 'Open AOI editor...' button is at the bottom.
4. **Visualization**: Features radio buttons for 'Boxes', 'Boxes + conf' (selected), and 'Centroid dots'. There are checkboxes for 'Draw centroid dot' and 'Save annotated images' (checked).
5. **Classes (load weights to populate)**: A 'Toggle:' section with 'All', 'None', and 'Invert' buttons. Below is a scrollable list of class names.
6. **Controls**: 'START' and 'ABORT' buttons are located above a progress bar. The progress bar is at 0% and labeled 'Ready.'.
7. **Log**: A text area at the bottom showing the timestamp '[15:07:38] Ready.'

When to use it ?

- Count cars in parking lots (e.g. drone images)
- Count birds during migration
- Detect objects in aerial images for GIS
- Count objects inside defined zones (AOI)
- Count (almost) anything with the right model

Where to get it?

Try it now on Gumroad:

ComputerVision Counter — Count anything without coding (from images)

ComputerVision Counter — Count anything without coding (from images)

⚠ Detection models are not included.
